R. S. Krishnamachari, Optimal design of large systems is easier if the optimization model can be decomposed and solved as a set of smaller, coordinated subproblems. Casting a given design problem into a particular optimization model by selecting objectives and constraints is generally a subjective task.

Design optimization is an engineering design methodology using a mathematical formulation of a design problem to support selection of the optimal design among many alternatives. Design optimization involves the following stages: Variables: Describe the design alternatives Objective: Elected functional combination of variables Constraints: Combination of Variables expressed as equalities or inequalities that must be satisfied for any acceptable design alternative Feasibility: Values for set of va

The engineering design process is a common series of steps that engineers use in creating functional products and processes. The process is highly iterative - parts of the process often need to be repeated many times before another can be entered - though the part(s) that get iterated and the number of such cycles in any given project may vary.. It is a decision making process (often iterative ...
